## Egyptians and Babylonians

Mathematics began as a practioal soienoe for conatructing calendars, adminlstaring harvests, organizing publio works and collecting taxess. At first the operations of arithmetion were emphasized, but they evolved into algebra by around 2090 B.0. This cocurred in two difforent parts of the word, Egypt (in north Africa) and Babylonia fthe Middle East).

The Egyptians wrote on papynus scrolls. Their method was simillar to our way of witing books today, but the method used by the Babyionlan was quite different. Thayimpressed wedge-like marks on clay tablets that were elthar baked hard in ovens or set to dry in the sun. Thesessolls and tablats are our sources of information about the great Egjplian and Eabylonian civilizations.

The Egyptian Rhind Papyris contahss material from about 1800 s.c. It is the oldest document in the world thai is devoted entirely to mathematios. When atratchad from end to end it measures 18 feat long and one foot wide.

The Rhind Papynis begins with soma lessons in arithmettc. Then it solves 84 problems in a wide variety of arase, Some problems are called "aha problems" because the unknown quantly was called "aha." Problem 24 is shown below in the original writing called hieroglyphics.

It reads:
Aha and its $1 / 7$ added together become 19. What is aha?
Today we write this problem as the equation $x+(1 / 7) x=18$. The Fhind Papyrus shows that aha is equal to $185 / 8$.

In Babylonia there was an abundance of tablets containing one problem each instead of one tablet containing many problems. Each tabletis about the size of the palm of your hand. The frontside of one tablet unearthed by archaelogists reads: I have multiplled length and width to obtain area 252. I have added length and witth to gat 32. What are the

length and wifth? The reverse side of the tablet gives the detalis of the solution: langith $=18$, width $=14$. Notice that when you multiply these numbers you get 252 and when you add them you got 32. The Babylonlans checked their work thls way too.

The mathod that the Eabylonians used to solve the problem is amazingly advanced. Toctay it is calied the "quadratic formula."

On the cover of this book a Babylonian student practices writing a muttiplication table on a ciay tablet. The teacher wrote a table on one half of the tablet, and the student must copy it.

Historical note by David ZItarelll

> IMPORTANT NOTICE: This book ls sold as a student workbook and is nof to be used as a duplicating master. No part of thls book may be reproduced In any form without the prior written permisslon of the publisher. Copyright Infringament is as violation of Federal Law.

## Multiplying

In arithmetic we wrote multiplication problems these two ways:

$$
3 \times 5=15 \quad \frac{\times 5}{15}
$$

In algebra we show multiplication by using a dot or by using parentheses. Below are some examples.

$$
3 \cdot 5=15 \quad 3(5)=15
$$

$$
(3)(5)=15
$$

Here are some multiplication problems for you to do:

| $4 \cdot 3=$ | $10 \cdot 7=$ | $2 \cdot 4=$ |
| :--- | :--- | :--- |
| $3 \cdot 6=$ | $(8)(3)=$ | $(11)(2)=$ |
| $(8)(4)=$ | $3 \cdot 5 \cdot 5=$ | $8(9)=$ |
| $4(4)=$ | $3(9)=$ | $10 \cdot 10=$ |
| $9 \cdot 10=$ | $1 \cdot 5=$ | $6 \cdot 5=$ |
| $6 \cdot 6=$ | $4 \cdot 9=$ | $9 \cdot 9=$ |

Below is a multiplication table that needs to be finished. Finish it and then use it to check the problems you just did.

|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | 2 | 3 | 4 | 5 | 6 |  |  |  |  |  |  |
| 2 | 2 | 4 | 6 | 8 |  |  |  |  |  |  |  |  |
| 3 | 3 | 6 | 9 |  |  |  |  |  |  |  |  |  |
| 4 |  |  |  |  |  |  |  |  |  |  |  |  |
| 5 |  |  |  |  |  |  |  |  |  |  |  |  |
| 6 |  |  |  |  |  |  |  | 48 |  |  |  |  |
| 7 |  |  |  |  |  |  |  |  |  |  |  |  |
| 8 |  |  |  |  |  |  |  |  |  |  |  |  |
| 9 |  |  |  |  |  |  |  |  |  |  |  |  |
| 10 |  |  |  |  |  |  |  |  |  |  |  |  |
| 11 |  |  |  |  |  |  |  |  |  |  |  |  |
| 12 |  |  |  |  |  |  |  |  |  |  |  |  |

## Factoring

In a multiplication problem like

$$
5 \cdot 7=35
$$

5 and 7 are called factors of 35. Factors are numbers which are multiplied. Many times in algebra we have to break down a number into factors. Both factors will have to be whole numbers. Here are some examples:

$12 \cdot 2$

$$
24=12 \cdot 2
$$

上
$2 \cdot 7$
$14=2 \cdot 7$

64

$64=8 \cdot 8$

Below are some numbers for you to factor. See if you can factor each number without using any fractions.

## Prime Numbers

Let's try to factor the number 17. The only way we can do it is like this:

We still end up with a 17, so you can see that we really didn't break down the 17 into two smaller numbers. In fact, that's impossible to do without using fractions. A number, like 17, that can only be factored into 1 times itself is called a prime number. 5 is also a prime number, since 1.5 is the only way it can be factored using whole numbers. Can you think of some more prime numbers? (Note: 1 is not considered a prime number. 2 is the smallest prime number.)

Try to factor each number into a product of smaller numbers. If a number is prime, draw a circle around it.

$$
\begin{array}{lllllll}
9 & 10 & 11 & 12 & 13 & 14 & 15
\end{array}
$$

16
18
19
20
21
22

## Prime Factors

Here are some numbers that we have already broken down:

However, only one of them has been broken down all the way. This time we are going to break them all the way down into prime factors:

Break down each number into prime factors.

## Integers

Integers are a lot like the whole numbers that you already know. The main difference is that there are negative integers as well as positlve integers. Zero is also an integer. Te is one way we can picture the set of integers:

As you can see, the negative integers are to the left of zero. We use a little raised minus sign to show that an integer is negative. Somatimes we use a liftle raised plus sign to show that an integer is positive, but we usually don't use any sign at all when the integer is positve. Zero Is neither positive nor negative.

## Comparing Integers

By looking at the number line we can easily tell which integers are greater (larger) than a certain number and which are less (smaller) than the number.

1 is greater than -2 because it is to the right of -2 .
-4 is less than -2 because it is to the left of -2 .
Write $>_{,}=$or < between the two integers to show whether the first is greater than, equal to or less than the second.

| $\circ^{\circ}$ <br> 11 greater than-2. |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 1 | -2 | -4 | 2 | -2 |
| 5 | 2 | -7 | -3 | 2 |
| 2 | 5 | -4 | -4 | -5 |
| 2 | 0 | 3 | -3 | 1 |
| 0 | 2 | -2 | -6 | -1 |

## Showing Gains and Losses

You can also use integers to show gains and losses. Positive integers show gains, and negative integers show losses. Zero is used if there is no change. Here is how we can use integers to show gains and losses in a football game:

You show the following gains and losses.

We lost 5 yards.

We gained 2 yards and then gained 6 more yards.

We gained 5 yards and then lost 8 yards.

## Adding Integers

In arithmetic you learned the operations of adding, subtracting, multiplying and dividing whale numbers and fractions. In algebra, one of the first things you have to learn is how to ad., subtract, multiply and divide integers.

To add integers we can think of a football game. A positive number stands for ground gained by our team; a negative number shows ground lost. Zero is used when there is no gain or loss. Here are some examples:

If you ever have trouble adding integers, then you can draw a football field to help you figure out the answer.

Use the football field to help you do each problem below.

$$
\begin{array}{lr}
-3+-5= & 13+-4= \\
6+4= & 8+-9= \\
8+-2= & -5+-6= \\
7+-7= & -14+6= \\
-3+5= & -1+10= \\
-4+9= & 1+-10= \\
6+-13= & -12+0= \\
-5+5= & 13+-13= \\
-6+-6= & 10+-20= \\
4+2= & 8+-16= \\
5+-3= & -12+25=
\end{array}
$$

Add.

$$
\begin{array}{llll}
-6+-3= & 4+5= & 3+2= & 7+6= \\
8+-5= & -9+-2= & 3+1= & 8+-4= \\
-5+-3= & -5+-8= & 3+0= & 9+-7= \\
-8+8= & -9+4= & 3+-1= & -7+-7= \\
-6+5= & 10+-8= & 3+-2= & -7+9= \\
12+-6= & 2+-11= & 3+-3= & -11+5= \\
-11+0= & 13+-9= & 3+-4= & -1+1= \\
-16+7= & -13+5= & 3+-5= & 17+-8= \\
8+-3= & -5+9= & 3+-6= & -14+14=
\end{array}
$$

$$
\begin{array}{rrrrrr}
2 & -5 & 6 & -7 & 9 & -11 \\
+6 \\
+ & +6 \\
\hline
\end{array}
$$

$14+0=$
$-6+0=$
$37+0=$
$-65+0=$
$0+3=$
$0+-8=$
$0+15=$
$0+39=$

Adding zero is easy! We just have to look at the other number in the problem and that's the answer. Here is a way we can say this:

> | If $a$ is any integer, then | $a+0=a$ |
| ---: | :--- |
| and $\quad$ | $0+a=a$. |

As is called the Principle for Adding Zero.

| $-3+7=$ | $5+8=$ | $-6+-2=$ |
| :--- | :--- | :--- |
| $7+-3=$ | $8+5=$ | $-2+-6=$ |
| $-16+-5=$ | $-16+18=$ | $-47+47=$ |
| $-5+-16=$ | $18+16=$ | $47+-47=$ |
| $-3+35=$ | $30+-80=$ | $-5+-21=$ |
| $35+-3=$ | $-80+30=$ | $-21+-5=$ |
| $-100+-62=$ | $100+99=$ | $100+-25=$ |
| $-62+-100=$ | $99+100=$ | $-25+100=$ |
| $100+-99=$ | $100+-53=$ | $100+-77=$ |
| $-99+100=$ | $-53+100=$ | $-77+100=$ |

As you can see from the problems on this page, it doesn't matter which of the numbers comes first when we are adding. We get the same answer either way. This is what we mean when we say that addition of integers is commutative.

Commutative Principle for Addition of Integers:
If $a$ and $b$ are integers, then $a+b=b+a$.
For example, $\underbrace{-3+7}_{4}=\underbrace{7+-3}_{4}$

On this page, the parentheses tell you which pair of numbers to add first.

| $\begin{array}{rl} 2 & 2 \\ (5+-3)+-6 & =-4 \\ 5+(\underbrace{-3+-6}_{-9}) & =-4 \end{array}$ | $\begin{aligned} & \overbrace{(-4+-8)}+-7= \\ & -4+(-8+-7)= \end{aligned}$ |
| :---: | :---: |
| $\begin{aligned} & (6+-4)+7= \\ & 6+(\underbrace{-4+7})= \end{aligned}$ | $\begin{aligned} & (-3+7)+-5= \\ & -3+\underbrace{7+-5})= \end{aligned}$ |
| $\begin{aligned} & (-8+7)+5= \\ & -8+(7+5)= \end{aligned}$ | $\begin{aligned} & (-3+-10)+6= \\ & -3+(-10+6)= \end{aligned}$ |
| $\begin{aligned} & (-6+-9)+9= \\ & -6+(-9+9)= \end{aligned}$ | $\begin{aligned} & (-23+-77)+-57= \\ & -23+(-77+-57)= \end{aligned}$ |

These problems show that it makes no difference which pair of numbers we add first. The answer always comes out the same. This is what we mean when we say that addition of integers is assoclatlye.

## Associative Principle for Addition of Integers:

If $a, b$ and $c$ are integers, then $(a+b)+c=a+(b+c)$.
For example, $(\underbrace{-8+7)+5}_{4}=-\underbrace{8+(7+5}_{4})$

Write a positive or negative number or zero for each sentence.

| The Bears lost 16 yards. | l6 |
| :--- | :---: |
| The Raiders gained 38 yards. |  |
| Don won 80¢. |  |
| Harry lost 65¢. |  |
| Tom broke even. |  |
| The temperature went up 8 degrees. |  |
| The temperature went down 13 degrees. |  |
| Marty lost 5 kilograms. |  |
| Irene gained 3 kilograms. |  |
| Barbara stayed the same weight. |  |
| Mr. Green spent \$20. |  |
| Mrs. Williams earned \$86. |  |
| Brenda lost \$3. |  |
| Theresa found \$1. |  |
| Carla didn't find anything. |  |
| The water level fell 7 centimeters. |  |

Write a problem for each sentence.

| The Giants gained 8 yards and then lost 5 yards. | $8+-5$ |
| :--- | :---: |
| The temperature fell 6 degrees and then fell 5 more degrees. |  |
| Marty lost 5 kilograms but then gained back 3. |  |
| Mrs. Williams got paid $\$ 86$ and then spent $\$ 40$. |  |
| Mr. Lopez lost $\$ 3$, but then he found $\$ 2$ of it. |  |
| The water level rose 11 cm and then fell 11 cm. |  |
| An airplane climbed 2000 meters, then climbed another <br> 1500 meters. |  |

For each exercise below you have to do two things.

1. First write down the problem.
2. Then find the answer.
me Jackets football team gained 9 yards on their first play. On the next three plays they lost 4 yards, gained 3 yards and lost 3 yards. How did the team do altogether on these four plays?

Problem: $9+-4+3+-3=5$
Answer: They gained 5 yards.
The Raiders gained 2 yards, lost 18 yards, lost 2 yards and then gained 10 yards. How did they do on these four plays?

## Problem:

Answer:
James was playing a game with his friends. He won 35 points. Then he lost 15, lost 40 and won 55. How did he come out?

## Problem:

Answer:
Donna won 43 points, lost 17, lost 19, won 17, lost 24, won 19 and lost 43.
How did she come out?

## Problem:

## Answer:

Shirlee had a savings account. Her first deposit was $\$ 35$. Then she deposited $\$ 10$, withdrew $\$ 20$, withdrew $\$ 5$, deposited $\$ 50$, withdrew $\$ 10$ and deposited $\$ 25$.
How much does she now have in her account?

## Problem:

## Answer:

Mr. Jackson had $\$ 100$ in his checking account. He wrote checks for $\$ 30, \$ 15$ and $\$ 20$. Then he deposited $\$ 50$ and wrote checks for $\$ 75, \$ 15$ and $\$ 10$. How much does Mr. Jackson have in his account now? (Do you see why the bank doesn't want Mr. Jackson to write any more checks?)

## Problem:

## Opposites

See how the integers are matched up in the picture? Each integer is matched with its opposite. We use a dash to show the opposite of a number.

| The opposite of 5 is -5. | $-(5)=-5$ |
| :--- | :--- |
| The opposite of -5 is 5. | $-(-5)=5$ |
| The opposite of 0 is 0. | $-(0)=0$ |
| The opposite of -13 is 13. | $-(-13)=$ |
| The opposite of 13 is -13. | $-(13)=$ |
| The opposite of -8 is 8. | $-(-8)=$ |
| The opposite of 8 is -8. | $-(8)=$ |

Here are some problems where you have to add opposites:

$$
\begin{array}{rr}
5+-5= & -5+5= \\
-3+3= & 3+-3= \\
46+-46= & -8+8= \\
0+0= & 8+-8= \\
167+-167= & -3647+3647=
\end{array}
$$

As you can see, whenever we add two opposites they cancel each other out - the answer always comes out zero.

$$
\begin{aligned}
\text { If } \left.a \text { is an integer, then } \begin{array}{rl}
a+-a & =0 \\
\text { and }-a+a & =0 .
\end{array} . \begin{array}{rl} 
&
\end{array}\right)
\end{aligned}
$$

This is called the Principle for Adding Opposites.

The problems on this page are too hard . . .
Make them easier by finding opposites and getting rid of them.

$$
\begin{aligned}
& 8+-8=0 \\
& 8+6+8+4=10 \\
& 5+2+-5+6= \\
& -7+6+-4+-6= \\
& 9+-2+8+-9= \\
& 3+-8+-3+8= \\
& 37+4+-37+-5= \\
& 6+-9+8+9+-6+3= \\
& -8+8+5+9+-5+6+9= \\
& 17+-28+56+28+-17= \\
& -12+5+-6+12+-5=
\end{aligned}
$$

James is still playing with his friends. He won 25 points. Then he lost 17, won 2, lost 19, won 2, won 17, lost 33, won 19, lost 25 and won 33 . How did he come out?

Problem:
Answer:

## Subtracting Integers

Once we have learned how to add and find opposites of integers, it is easy to subtract them. Every subtraction problem has the same answer as an addition problem.

$$
\left\{\begin{array} { l } 
{ 8 - 5 = 3 } \\
{ 8 + - 5 = 3 }
\end{array} \quad \left\{\begin{array}{l}
10-1=9 \\
10+-1=9
\end{array}\right.\right.
$$

To find the answer to a subtraction problem, all we have to do is change it to an addition problem - but instead of subtracting the second number we add the opposite of the second number.
Here is another example: $-5-4=$
Instead of subtracting positive 4 we are going to add negative 4; so here's how you can change the problem:

$$
-5+-4=
$$

Now the problem is just like the adding problems we have already done.
A loss of 5 and a loss of 4 comes out to a loss of 9 :

$$
-5+-4=-9
$$

Below are some more subtraction problems. Change each problem to an addition problem. Remember to add the opposite of the second number.

$$
\begin{array}{rr}
6+-8=-2 & 4-9= \\
-4-8= & -5-3= \\
5-9= & -9-4= \\
8-5= & 4-7= \\
-3-6 & = \\
-8-8= & 7-2= \\
& -1-6=
\end{array}
$$

In this subtraction problem the number being subtracted is negative:

$$
7--5=
$$

First we have to change the problem. We have to add the opposite of the second number, so instead of subtracting negative 5 we are going to add positive 5:

$$
7++5=
$$

A gain of 7 and a gain of 5 is the same as a gain of 12:

$$
7++5=12
$$

If this seems strange to you, think of the football field. When the referee takes away or rules out a 5 yard loss, we gain back the 5 yards.

Subtract.

$$
\begin{aligned}
-3++7 & =4 \\
5--9 & = \\
8--3 & = \\
-6--4 & = \\
-9--6 & = \\
-8--8 & = \\
10--5 & = \\
-10--5 & = \\
2--9 & = \\
-2--9 & =
\end{aligned}
$$

Be careful on these.

$$
\begin{aligned}
& 6--8= \\
& 6-8= \\
& -6--8= \\
& -6-8=
\end{aligned}
$$

As you can see, every time we have a subtraction problem, we can change it to an adding problem. But we have to remember to add the opposite of the second number:

If $a$ and $b$ are integers, then $a-b=a+-b$.

Subtract. Remember to add the opposite of the second number. (If the second number is positive, change it to negative.
If the second number is negative, change it to positive.)

| $4-2=$ | $5--3=$ | $-3--4=$ | $-6-2=$ |
| ---: | ---: | ---: | ---: |
| $-6--3=$ | $4-5=$ | $-3--7=$ | $7-6=$ |
| $8--5=$ | $-9--2=$ | $-2-7=$ | $8--4=$ |
| $-5--3=$ | $5-9=$ | $2--7=$ | $9--7=$ |
| $-8-8=$ | $-5--8=$ | $1-9=$ | $-7--7=$ |
| $8--3=$ | $-9-4=$ | $-8--3=$ | $7-9=$ |
| $-6--5=$ | $10--8=$ | $-12--4=$ | $-11-5=$ |
| $12--6=$ | $11--2=$ | $0-5=$ | $-1-1=$ |
| $-11-0=$ | $13--9=$ | $-15--6=$ | $17--8=$ |
| $-16-7=$ | $-13-5=$ | $18--9=$ | $-14-14=$ |
| $14--5=$ | $8-9=$ | $4-8=$ | $0--6=$ |
| $-10-10=$ | $-1--8=$ | $7-7=$ | $-14--4=$ |

Subtract.
(Remember . . . add the opposite of the bottom number.)

| -5 |
| ---: |
| -6 | | 6 |
| ---: |
| $-\quad-9$ | | 2 |
| ---: |
| $-\quad 6$ |
| -8 |
| -8 |
| -16 |
| -13 |

$$
\begin{array}{r}
6 \\
-\quad-11 \\
-\quad-9 \\
\hline
\end{array}
$$

Add or subtract as indicated.

| $-6+10=$ | $-3+-11=$ |
| :--- | :--- |
| $-6-10=$ | $-3--11=$ |
| $9+7=$ | $6+-9=$ |
| $9-7=$ | $6--9=$ |
| $-8+2=$ | $-7+-6=$ |
| $0-7--6=$ |  |
| $8-2=$ | $12+-8=$ |
| $3+10=$ | $12--8=$ |
| $3-10=$ | $-18+18=$ |
| $-35+-15=$ | $-18-18=$ |
| $-35--15=$ |  |
| 0 |  |

Add. (Think of gaining and losing yards.)

$$
\begin{array}{rrrrr}

$$

$$
7-7-7-7=
$$

Multiplying Intagers
To name an integer we have to do two things. We have to tell the sign of the integer (positive or negative), and we also have to tell the amount.
When we multiply two integers, we need to break down the problem into two parts. First we figure out the sign of the answer; then we figure out the amount of the answer. To figure out the sign of the answer, all we have to do is remember these four rules:

$$
\begin{aligned}
& \text { POSITIVE - POSITIVE }=\text { POSTTIVE } \\
& \text { POSITIVE - NEGATIVE }=\text { NEGATIVE } \\
& \text { NEGATIVE - POSITIVE }=\text { NEGATIVE } \\
& \text { NEGATIVE - NEGATIVE }=\text { POSITIVE }
\end{aligned}
$$

To figure out the amount of the answer, we just multiply.
Multiply.

| $8 \cdot-3=$ | $5 \cdot-4=$ | $-5 \cdot 4=$ |
| :--- | :--- | ---: |
| $-8 \cdot-3=$ | $-8 \cdot 2=$ | $-6 \cdot 7=$ |
| $8 \cdot 3=$ | $5 \cdot-6=$ | $8 \cdot 5=$ |
| $-8 \cdot 3=$ | $-3 \cdot-7=$ | $-4 \cdot-6=$ |
|  | $-8 \cdot-1=$ | $9 \cdot-7=$ |
| $-6 \cdot-6=$ | $4 \cdot 8=$ | $7 \cdot-9=$ |
| $6 \cdot-6=$ | $-9 \cdot-8=$ | $-3 \cdot 6=$ |
| $-6 \cdot 6=$ | $-7 \cdot 7=$ | $-5 \cdot-7=$ |
| $6 \cdot 6=$ | $1 \cdot-3=$ | $-1 \cdot 9=$ |
|  | $5 \cdot 0=$ | $-10 \cdot-8=$ |
| $2 \cdot 0=$ | $-4 \cdot-7=$ | $9 \cdot-10=$ |
| $-2 \cdot 0=$ | $0 \cdot-9=$ | $8 \cdot 7=$ |
| $2 \cdot-2=$ | $0 \cdot 8=$ | $-11 \cdot 3=$ |

$-5 \cdot 4=$
$-6 \cdot 7=$
8-5 =
$-4 \cdot-6=$
9- $-7=$
$7 \cdot-9=$
$-3 \cdot 6=$
$-5 \cdot-7=$
$-1 \cdot 9=$
$-10 \cdot-8=$
$9 \cdot-10=$
$8 \cdot 7=$
$-11 \cdot 3=$

To see why these rules work we can think again about a football game. The first integer tells how many plays were made. A positive integer tells how many plays were made by ourteam; a negative integer tells how many plays were made by the otherteam.
The second integer tells how many yards were gained or lost on each play. rusitive integers show yards gained; negative integers show yards lost.
The answertells the outcome in terms of how many yards our team gained or lost. Here are some examples:

If it seems strange that we get a positive answer by multiplying two negative numbers, just remember that a loss for the other team is a gain for us. We can draw a football field and map out the plays to see why this is so.

Multiply.

$$
\begin{array}{r}
6 \cdot 7= \\
-6 \cdot-7= \\
6 \cdot-7= \\
-6 \cdot 7= \\
-9 \cdot-5= \\
9 \cdot-5= \\
9 \cdot 5= \\
-9 \cdot 5=
\end{array}
$$

Here's an easy way to tell the sign of the answer:

$$
\left.\begin{array}{l}
\text { Both poalive } \\
\text { both negative }
\end{array} \begin{array}{c}
4 \cdot 6=24 \\
-4 \cdot-6=24
\end{array}\right\} \begin{gathered}
\text { Answer } \\
\text { positive. }
\end{gathered}
$$

$-8 \cdot-6=$

$$
-9 \cdot 9=
$$

$$
8 \cdot-8=\quad-9 \cdot-6=
$$

$-3 \cdot 5=$

| $4 \cdot 6=$ | $9 \cdot-7=$ | $-1 \cdot 16=$ | $-5 \cdot-1=$ |
| :--- | :--- | :--- | :--- |
| $6 \cdot 4=$ | $-7 \cdot 9=$ | $16 \cdot-1=$ | $-1 \cdot-5=$ |
| $-5 \cdot 8=$ | $-3 \cdot-7=$ | $-12 \cdot 0=$ | $-8 \cdot-9=$ |
| $8 \cdot-5=$ | $-7 \cdot-3=$ | $0 \cdot-12=$ | $-9 \cdot-8=$ |

It doesn't matter which of the numbers comes first when we are multiplying, so we say that multiplication of integers is commutative.

Commutative Principle for Multiplication of Integers:
If $a$ and $b$ are integers, then $a \cdot b=b \cdot a$.
For example, $\underbrace{-3 \cdot 4}_{-12}=\underbrace{4 \cdot-3}_{-12}$

Multiply.

| $-3(9)=$ | $(6)(-5)=$ |
| :--- | :--- |
| $-8(-9)=$ | $(-4)(-6)=$ |
| $7(8)=$ | $(-5)(7)=$ |
| $-6(-6)=$ | $(9)(9)=$ |
| $1(9)=$ | $9(7)=$ |
| $-10 \cdot-9=$ | $9 \cdot 7=$ |
| $(-8)(1)=$ | $(9)(7)=$ |
| $6(-8)=$ | $(3 \cdot 3) \cdot 7=$ |
| $(2)(43)=$ | $3 \cdot(3 \cdot 7)=$ |

Here are three different ways to write a multiplication problem:

$$
\begin{aligned}
3 \cdot-7 & =-21 \\
3(-7) & =-21 \\
(3)(-7) & =-21
\end{aligned}
$$

All of them say:
" 3 times -7 equals -21."

| $(-3 \cdot 5) \cdot 4=$ <br> $-3 \cdot \underbrace{5 \cdot 3}_{20} \cdot 4)$$=$ | $(-6 \cdot 8) \cdot-2=$ <br> $-6 \cdot(\underbrace{8 \cdot-2)}$$=$ |
| :--- | :--- |
| $(5 \cdot-8) \cdot-2=$ |  |
| $5 \cdot(-8 \cdot-2)=$ | $(-2 \cdot-2) \cdot-2=$ |
| $-2 \cdot(-2 \cdot-2)=$ | $(-3 \cdot-2) \cdot-5=$ <br> $-3 \cdot(\underbrace{-2 \cdot-5)}=$ |

It doesn't matter which pair of numbers we multiply first. The answer comes out the same jither way, so we say that multiplication of integers is associative.

## Associative Principle for Multiplication of Integers:

If $a, b$ and $c$ are integers, then $(a \cdot b) \cdot c=a \cdot(b \cdot c)$.
For example, $\underbrace{(5 \cdot-2) \cdot 3}_{-30}=\underbrace{5 \cdot(-2 \cdot 3)}_{-30}$

Multiply.

| $\underbrace{2 \cdot 6}_{03} \cdot-3=-36$ | $(3)(7)(-2)=$ | $-5 \cdot 6 \cdot-3=$ |
| :--- | :--- | :--- |
| $4 \cdot-5 \cdot 3=$ | $(-3)(-3)(-3)=$ | $8 \cdot-2 \cdot-4=$ |
| $-8 \cdot-2 \cdot-2=$ | $(5)(-10)(2)=$ | $-1 \cdot-1 \cdot 12=$ |
| $6 \cdot-5 \cdot-3=$ | $(4)(4)(4)=$ | $46 \cdot-37 \cdot 0=$ |

$$
\underbrace{2 \cdot 6}_{13} \cdot-3=-36
$$

$$
(3)(7)(-2)=
$$

$$
-5 \cdot 6 \cdot-3=
$$

$$
4 \cdot-5 \cdot 3=
$$

$$
(-3)(-3)(-3)=
$$

$$
8 \cdot-2 \cdot-4=
$$

$$
-8 \cdot-2 \cdot-2=
$$

$$
(5)(-10)(2)=
$$

$$
-1 \cdot-1 \cdot 12=
$$

$$
6 \cdot-5 \cdot-3=
$$

$$
(4)(4)(4)=
$$

$$
46 \cdot-37 \cdot 0=
$$

Multiply.

| $6 \cdot 0=$ | $0 \cdot 7=$ | $8 \cdot 1=$ | $1 \cdot 3=$ | $5 \cdot-1=$ |
| :--- | :--- | :--- | :--- | :--- |
| $8 \cdot 0=$ | $0 \cdot-3=$ | $-6 \cdot 1=$ | $1 \cdot-5=$ | $9 \cdot-1=$ |
| $-4 \cdot 0=$ | $0 \cdot 0=$ | $-1(18)=$ |  |  |
| $-13 \cdot 0=$ | $0(16)=$ | $-16 \cdot 1=$ | $1 \cdot 1=$ | $-4 \cdot-1=$ |
| $48 \cdot 0=$ | $-1 \cdot-6=$ |  |  |  |
| $(-29)(0)=$ | $0 \cdot 1=$ | $-63 \cdot 1=$ | $1(26)=$ | $-1 \cdot-1=$ |
|  | $0 \cdot-58=$ | $-1(-23)=$ |  |  |
|  | $80 \cdot 1=$ | $1 \cdot 0=$ | $-8 \cdot-1=$ | $-1 \cdot 1=$ |

Sometimes multiplying can be pretty hard to do - but not when we are multiplying by 0,1 or -1 . Then it's very simple. Here are the principles that tell us what to do:

Principle for Multiplying by Zero: If $a$ is any integer, then $a \cdot 0=0$ and $0 \cdot a=0$.

Principle for Multiplying by One:
If $a$ is any integer, then $a \cdot 1=a$ and $1 \cdot a=a$.

Principle for Multiplying by Negative One:
If $a$ is any integer, then $a^{-1}=-a$ and $-1 \cdot a=-a$.
"Any integer times negative one is the opposite of the integer."

## Order of Operations

 Look at this problem:$$
4 \cdot(5+2)=
$$

The parentheses tell us to add $\mathbf{5 + 2}$ first, and then to multiply the answer by 4:

$$
4 \cdot(\underbrace{5+2}_{7})=28
$$

Below are some problems for you to do.

$$
\begin{array}{lll}
5 \cdot(2+3)= & 7-(5-2)= & (-6+4) \cdot 3= \\
(5 \cdot 2)+3= & (7-5)-2= & -6+(4 \cdot 3)=
\end{array}
$$

$5+(2 \cdot 3)=$
$7+(5+2)=$
$(-2 \cdot-2)+6=$
$(3+2) \cdot 3=$
$(7+5)+2=$
$-2 \cdot(-2+6)=$
$(4-3) \cdot(5-1)=$

$$
(3 \cdot 4)+(4 \cdot 2)+(3 \cdot 3)=
$$

$(3-5) \cdot(10-6)=$
$(-3 \cdot 4)+(4 \cdot 2)+(-3 \cdot-3)=$
$(5-3) \cdot(6-10)=$

$$
(-3 \cdot-4)+(-4 \cdot 2)+(3 \cdot-3)=
$$

$(3-5) \cdot(6-10)=$

$$
(-3 \cdot-4)+(-4 \cdot-2)+(-3 \cdot-3)=
$$

(4) 3$) \cdot(10-6)=$

$$
(-3 \cdot 4)+(4 \cdot-2)+(-3 \cdot 3)=
$$

Here is a problem that doesn't have any parentheses to show what to do first:

$$
5+3 \cdot 4
$$

There are two ways you could try to do this problem. Multiplying first:

$$
5+\underbrace{3 \cdot 4}_{12}=17
$$

c

Adding first:

$$
\underbrace{5+3}_{8} \cdot 4=32
$$

As you can see, the answers are different. The first one, 17, is right because of a rule we always follow in doing computations:

1. If there are parentheses, first do what is in them.
2. Then do all the multiplying, from left to right.
3. Finally, do the rest of the adding and subtracting, from left to right. See if you can follow this rule on each problem below.

$$
\begin{array}{lll}
(8+5) \cdot 2= & (5+-7) \cdot 2= & 7+(6-2) \cdot 5= \\
8+5 \cdot 2= & 5+-7 \cdot 2= & 16+3 \cdot 7-12= \\
7 \cdot 3+10= & 8 \cdot(2-4)= & 6 \cdot 4+5 \cdot 4= \\
(6+2) \cdot 4= & 8 \cdot 2-4= & 8+4 \cdot(5+2)= \\
5 \cdot 6-12= & -5+3 \cdot-2= & 5 \cdot(7-3)-6= \\
25-3 \cdot 6= & -5 \cdot 3+-2= & 9-(3+4)-2= \\
3 \cdot(6+4)= & -2+-2 \cdot-2= & 12+5 \cdot(8-2)=
\end{array}
$$

Were you surprised to see the answers come out the same in each pair of problems? If you were, then try thinking about it like this:

loesn't it make sense for the answers to come out the same? After all, 3 fives and fives is equal to 7 fives. Since this works for any integers we may choose, we say that ulltiplication of integers is distributive over addition.

Distributive Principle:
If $a, b$ and $c$ are integers, then $(b+c) \cdot a=b \cdot a+c \cdot a$ and $a \cdot(b+c)=a \cdot b+a \cdot c$.

You've learned two ways to solve this problem:

$$
5(3+8)=
$$

On page 30 you learned to do what is in the parentheses first, then multiply:

$$
5(3+8)=5(11)=55
$$

And on page 31 you learned that using the Distributive Principle gives the same answer:

$$
5(3+8)=5(3)+5(8)=15+40=55
$$

When we use the Distributive Principle we can save some work by doing the multiplications in our head and just writing the products:

$$
5(3+8)=15+40=55
$$

Do each problem two ways.

| $6(4+6)=6(10)=60$ | $7(20+8)=$ |
| :--- | :--- |
| $6(4+6)=24+36=60$ | $7(20+8)=$ |
| $3(8+2)=$ | $8(-4+1)=$ |
| $3(8+2)=$ | $8(-4+1)=$ |
| $-4(9+-3)=$ | $-3(30+-2)=$ |
| $-4(9+-3)=$ | $-3(30+-2)=$ |

$$
\begin{aligned}
& 3(2-6)=3(2+-6)=3(-4)=-12 \\
& 3(2-6)=3(2+-6)=6+-18=-12
\end{aligned}
$$

$$
\begin{aligned}
& 10(3-8)= \\
& 10(3-8)=
\end{aligned}
$$

$$
\begin{aligned}
& -2(-4-7)= \\
& -2(-4-7)=
\end{aligned}
$$

## Dividing Integers

In division problems, the number we divide by is called the divisor and the number we divide into is called the dividend.

When you divide integers you have to break down the problem into two parts. We find the amount of the answer by dividing, and we find the sign of the answer by following these rules:
POSITIVE - POSITIVE $=$ POSITIVE
POSITIVE NEGATIVE $=$ NEGATIVE
NEGATIVE P POSITIVE $=$ NEGATIVE
NEGATIVE NEGATIVE $=$ POSITIVE

These rules are the same as the rules for multiplication. That's because the answer to a division problem can be found by reversing a multiplication problem.

| $18+3=6$ | because | 6 | times 3 is 18. |
| ---: | :--- | ---: | :--- |
| $18+-3=-6$ | because | -6 | times -3 is 18. |
| $-18+3=-6$ | because | -6 times 3 is -18. |  |
| $-18+-3=6$ | because | 6 times -3 is -18. |  |

Here are some division problems for you:

$$
\begin{array}{rrr}
12 \div 3=4 & 10 \div 5= & -18 \div 6= \\
-12 \div-3=4 & -10 \div-5= & 18 \div 6= \\
12 \div-3=-4 & 10 \div-5= & 18 \div-6= \\
-12 \div 3=-4 & -10 \div 5= & -18 \div-6= \\
-7 \div-7= & -15 \div 1= & -9 \div-9= \\
-7 \div 7= & -15 \div-1= & -9 \div 9= \\
7 \div 7= & 15 \div-1= & 0 \div 9= \\
7 \div-7= & 15 \div 1= & 9 \div 0=
\end{array}
$$

Lord you get the last two problems? If not, the next page may help you.

$12 \div 4=3$

$$
\begin{aligned}
& 0 \div 9^{000}=\text { What number times } 9_{\text {equals }}^{0} \begin{array}{l}
\text { 0? } \\
0 \div 9=0
\end{array} \\
& \\
& \\
& \\
& \\
& \\
& \text { This problem has no answer. }
\end{aligned}
$$

In fact, no number divided by zero has an answer. That's why we say:

## We can never divide by 0.

Do these problems. If a problem has no answer, cross it out.

$$
\begin{array}{ll}
(7-7) \div(4+6)=0 \div 10=0 & (5+5) \div(5-5)= \\
(-8+2) \div(-3+3)= & (-3-2) \div(-3+2)= \\
(-3+3) \div(-8+2)= & (-6--6) \div(5+2)= \\
(12-4) \div(4-12)= & (7+7) \div(-7--7)= \\
(4-12) \div(12-4)= & (6+4) \div(4-6)= \\
(11+-11) \div(-3+-3)=
\end{array}
$$

## IMPORTANT NOTICE

There are two big differences between dividing integers and the other operations you have learned (adding, subtracting and multiplying).

1. We can never divide by zero.
2. If the divisor doesn't go into the dividend evenly, then the answer will not be an integer. For example, $10+3$ does not equal any integer. We will discuss problems like this when we study rational numbers in Book 5.

## Written Work

Do these problems on some clean paper. Label each page of your work w.h your name, your class, the date, and the book number. Also number each problem. Keep this written work inside your book, and turn it in with your book when you are finished. Please do a neat job.

1. Make a list of all the prime numbers up to 50. (See page 4 if you need help.)
2. Break down each of these numbers into prime factors: $8,45,50,150,256,500$. (See page 5.)

| Written Whrk Book "I |  | Yaser Nom <br> Porict Me. <br> Dats |
| :---: | :---: | :---: |
| (1) 2,3,5,7, |  |  |
| $\begin{gathered} \text { (1) } \\ 2 \cdot 4 \\ 2 \cdot 2 \\ 2 \cdot 2 \\ 8=2 \cdot 2 \cdot 2 \end{gathered}$ | 45 | ㄷㅅㅇ |
| $\stackrel{150}{ }$ | ${ }^{256}$ | $\stackrel{500}{ }$ |
| (5) 1 <br> Integers are <br> (4) a. $5+0=5$ $\text { b. }-3+5=5+-3$ |  |  |

3. What are integers? (See page 7.)
4. Write down an example of each of these principles:
a. Principle for Adding Zero (See page 11.)
b. Commutative Principle for Addition of Integers (See page 12.)
c. Associative Principle for Addition of Integers (See page 13.)
d. Principla for Adding Opposites (See page 16.)
e. Commutative Principle for Multiplication of Integers (See page 26.)
5. Associative Principle for Multiplication of Integers (See page 27.)
g. Princlple for Multiplying by Zero (See page 28.)
h. Principle for Multiplying by One (See page 28.)
i. Distributive Principle (See page 31.)
6. Write a story to fit this problem: $40+-5+-25+-10=$
7. Sandy and Terry got into an argument about the following problem:

$$
6+2 \cdot 5=
$$

Sandy said the problem should be done like this:

$$
\underbrace{6+2}_{8} \cdot 5=40
$$

Terry said that this was the correct way:

$$
6+\underbrace{2 \cdot 5}_{10}=16
$$

Who was right? Explain why. (See page 30.)

- Why can't we divide by zero?

## Practice Test

You are now ready to take the practice test to find out how well you understand the work in this book. When you are finished with the test, ask your teacher for the answer key so you can correct it yourself. Then you can review the sections where you still need practice. Good luck!
Break down each number into prime factors.

Add.

| $5+8=$ | $6+-6=$ | $-6+4=$ |
| :--- | ---: | ---: |
| $8+-2=$ | $-4+-3=$ | $0+-7=$ |
| -5 | -3 | 2 |
| +-4 | +10 | +-9 |

Subtract.

| $5-8=$ | $6--6=$ |  | $-6-4=$ |
| :--- | ---: | ---: | ---: |
| $8--2=$ | $-4-3=$ |  | $0--7=$ |
| -5 | -3 | 2 | 9 |
| --4 | -10 | -9 | -2 |

Multiply.

$(8)(-2)=$

$(6)(-6)=$
$-4 \cdot-3=$
$-6(4)=$
$0 \cdot-7=$

Divide.

$$
\begin{array}{rrr}
-14 \div-2= & 0 \div 5= & 48 \div-6= \\
6 \div-3= & -8 \div-8= & -18 \div-1=
\end{array}
$$

Compute.

$$
\begin{array}{lll}
5 \cdot-2+4= & 5 \cdot 3+5 \cdot 4= & 4+(8-3) \cdot 2= \\
5(-2+4)= & 5(3+4)= & 5+3 \cdot 2-6= \\
5+-2 \cdot 4= & -6 \cdot 2+-4 \cdot 2= & 3+5 \cdot(5-2)= \\
(5+-2) \cdot 4= & (-6+-4) \cdot 2= & 5(4-1)-6=
\end{array}
$$

Match an example with each principle.Principles
